前言

香港政府首次對昆蟲進行的系統性研究，是由 1930 年代的醫療部門而非漁農自然護理署(漁護署)或其前身所推行。殖民地政府於 1930 年從海峽殖民地招聘了 Robert Best Jackson 醫生，並任命他為首位政府瘧疾學家。他設立了瘧疾局，並就流行病學和控制瘧疾進行研究。在他任職八年期間，Jackson 醫生發表了許多有關在香港發現的蚊子物種的重要論文，為公共衛生而進行的昆蟲研究奠定了穩固的基礎。

漁護署研究昆蟲的歷史相對較短，主要集中於農業害蟲及其天敵。部門人員收集所得的第一個昆蟲標本可追溯至 1960 年，當時部門剛好由“農林漁業管理處”改名為“農林處”。展開相關工作的政府人員為蘇培業先生，而昆蟲儲存室則設於大龍農場內。蘇先生使用一個簡單但有效的系統(索引卡)，記錄昆蟲／寄主和寄主／昆蟲的關係，並於 1967 年出版了《香港重要農業昆蟲初步名錄》(A Preliminary List of the Insects of Agricultural Importance in Hong Kong)。他辛勤地記錄了相當多重要農業昆蟲在香港出現的周期，並對研究這些昆蟲在本地氣候和種植模式下每年發生的世代數作出重大貢獻。蘇先生的繼任人為李熙瑜先生，他是首位擁有“昆蟲學家”正式職銜的公務員。李先生的興趣在於十字花科作物的蚜蟲生態及相關的控制措施。李先生並在其博士論文(1977)中記錄了他在香港大學修讀期間遇到的一些常見瓢蟲。其繼任人，亦是最後一任政府昆蟲學家為溫禮賢先生，他對香港的天牛和螞蟻動物群的生物多樣性均感興趣。本地昆蟲的鑑定工作主要由著名的海外專家根據已裝裱或保存的標本進行。溫先生和他的團隊花了很多時間和精力，從受天牛侵擾的樹上砍下樹枝，並把這些樹枝放在實驗室裏，等待成年甲蟲孵化出來，以保存標本進行後續鑑定。天牛的生命周期非常長，由數個月至數年不等。憑着溫先生的努力和耐心，為本地林業害蟲提供了寶貴的實地數據。此外，他個人對螞蟻的興趣也豐富了部門對這種具有重要生態價值的陸上無脊椎動物的知識。許多螞蟻物種為取得樹蜜，均“飼養” 蚜蟲、蚧蟲、粉蚧和木蝨。溫先生的螞蟻收藏品為日後研究螞蟻、植物和同翅目之間的三方共生關係提供了堅實的基礎。於 1981 年後期，李先生和溫先生共同撰寫了《香港農作昆蟲名錄》，至今仍然是本地農作物病蟲害的重要參考資料。

作者於 1980 年代後期加入部門，從事植物保護和植物檢疫工作。在同一時期，政府開始重視市區綠化和郊野公園的發展，積極推行植樹計劃，並大量種植園藝植物和林地物種。然而，與這些植物有關的害蟲卻幾乎沒有任何參考資料。大龍農場收集的昆蟲主要是農業害蟲，因此幫助不大。在此情況下，作者決定重拾李先生和溫先生所留存的昆蟲名錄。作者查閱舊有文獻以了解有關香港昆蟲發現事件的報道。一些經典參考文獻，包括由胡經甫博士撰寫的六卷《中國昆蟲名錄》、1930 年代後期由嶺南大學出版的嶺南科學雜誌，還有 1950 年代的 Memoirs of the Hong Kong Biological Circle，這份出版物後來成為 Memoirs of the Hong Kong Natural History Society。1950 年代由嘉理斯博士和 1960 年代由木元新作先生所

出版的刊物，也是有關本港天牛和葉甲的重要參考資料。作者還訂閱了一些重要的中國昆蟲學期刊，以便更詳細了解香港及其附近地區發現的昆蟲的生物學。

隨着時間的推展，越來越多本地和海外的昆蟲學家有系統地研究來自香港的不同昆蟲群體，並在科學文獻中發表他們的發現。其中 John Tennent 致力於天蛾科的研究；高德年和甘狄克從事研究飛蛾的工作；Mike J. Bascombe、楊建業和羅益奎致力於蝴蝶的研究；何維俊從事研究竹節蟲的工作；Jon H. Martin 研究蚜蟲、木蝨和粉蝨；Guillaume-Marie de Rougemont 研究隱翅蟲；賈鳳龍從事研究水生甲蟲的研究；虞國躍致力於瓢蟲的研究工作；韋敬輝研究蜻蜓；John R. Fellowes 和管訥傯研究螞蟻；Paul W. Schaefer 研究毒蛾屬 (*Lymantria*) 飛蛾及其天敵；Christophe Barthélémy 和李信全研究蜜蜂和黃蜂；華立中致力於天牛的研究；Paul Aston 研究甲蟲；以及高道蓉研究白蟻。

正確的鑑定，是任何生物學學習和研究的其中一項最重要和最基本的要求。作者感謝以下在鑑定香港昆蟲方面提供了寶貴協助的昆蟲學家：虞國躍 (BAAFS)、華立中 (SYSU)、龐雄飛 (已歿，SCAU)、龐虹 (GEIC)、蒲富基 (CAS)、吳蔚文 (SWAU)、虞佩玉 (已歿，CAS)、盧文華 (CA)、白明 (CAS)、聶瑞娥 (CAS)、楊干燕 (先前在 CAS)、殷惠芬 (CAS)、王志良 (CAS)、楊玉霞 (CAS)、史紅亮 (CAS)、梁宏斌 (CAS)、胡曉燕 (CAS)、阮用穎 (CAS)、Michael L. 作者藉此機會向他的高考英語老師 Lindy Mogford 女士就編輯引言的手稿文本致以最誠摯的謝意。作者亦衷心感謝張祝珊英文中學的生物科老師程期浩先生，以及英華女學校的生物科老師葉王易安女士和曹沛文女士。他們啟發了作者學習生物學的興趣，引導他耐心地邁向目標，並裝備他擁有實現目標的能力。

Preface

The first ever systematic study of insects conducted by the Hong Kong Government was carried out by the medical department instead of the Agriculture, Fisheries and Conservation Department (AFCD) or its predecessors in the 1930s. In 1930, the Colonial Government recruited Dr Robert Best Jackson from the Straits Settlements and appointed him as the first government malariologist. He set up the Malaria Bureau and conducted research on the epidemiology and control of malaria. During his eight years of service, Dr Jackson published a number of important papers on the mosquito species found in Hong Kong, which laid a solid foundation for insect study in public health.

AFCD has a relatively short history of insect research and its focus is primarily on agricultural pests and their natural enemies. The first insect specimen collected by the departmental staff can be traced back to 1960, when the department was renamed from the Agriculture, Fisheries and Forestry Department to the Agriculture and Forestry Department. The public officer who started the work was Mr So Pui Yip, with the insect depository located at the Tai Lung Farm. Mr So used index cards, a simple but effective system, to record the insect-host and host-insect relationships, and published A preliminary List of the Insects of Agricultural Importance in Hong Kong in 1967. He recorded arduously the emerging cycles of a number of important agricultural insects in Hong Kong and contributed significantly to the knowledge on the number of broods per year these insects produce under local climate and cropping patterns. Mr Lawrence Hay Yue Lee, the successor of Mr So, was the first civil servant bearing the official title of entomologist, whose interest was in the ecology of aphids on cruciferous crops and the associated control measures. Mr Lee also documented in his PhD thesis (1977) some of the common ladybirds he encountered during his course of study at the University of Hong Kong. Mr Richard Winney, the succeeding and the last government entomologist, had a keen interest in the biodiversity of local longhorn and ant fauna. Identifications of local insects were mostly carried out by renowned overseas experts, based on mounted or preserved specimens. Mr Winney and his team spent lots of time and effort on cutting branches from longhorn-infested trees and keeping them in the laboratory, waiting for hatching of adult beetles in order to preserve specimens for subsequent identification. The life cycle of longhorns is exceedingly long, ranging from a few months to a few years. The effort and patience of Mr Winney yielded valuable field data of local forestry pests. Furthermore, his personal interest in ants also enriched the departmental knowledge of this ecologically important group of terrestrial invertebrates. Many species of ants “farm” aphids, scale insects, mealybugs and psyllids for their honeydew. Mr Winney’s collection of ants has provided a solid foundation for future study on the tripartite symbiotic relationship between ants, plants and homopterans. Later in 1981, Messrs Lee and Winney co-authored the Check List of Agricultural Insects of Hong Kong, which still serves as an important reference for local crop pests.

The author joined the department in the late 1980s, concentrating on plant protection and plant quarantine. At around the same period of time, the Government began to attach great importance to urban greening and the development of country parks by actively implementing tree planting programmes and growing lots of garden plants and woodland species. Yet there was hardly any reference on pests associated with these vegetations. The insect collection of the Tai Lung Farm did not offer much help as its focus was on agricultural pests. It was under such circumstances that the author decided to pick up the insect checklist from where Messrs Lee and Winney had left off. The author looked up older literature for reports on insect occurrence in Hong Kong. Some classical references include the six volumes of Catalogus Insectorum Sinensium by Dr Francis Chenfu Wu, the Lingnan Science Journal published by the Lingnan University in the late 1930s, and the Memoirs of the Hong Kong Biological Circle published around the 1950s, which later became the Memoirs of the Hong Kong Natural History Society. Publications by Dr Judson Linsley Gressitt in the 1950s and Mr Shinsaku Komoto in the 1960s served as important references for longhorns and leaf beetles in the territory. The author also subscribed to a number of key Chinese entomology journals in order to have a better understanding of the biology of insects occurring in Hong Kong and its vicinity.

As time moves on, more and more local and overseas entomologists have studied systematically different groups of insects from Hong Kong and published their findings in scientific literature. They include John Tennent working on the Sphingidae; Anthony C. Galsworthy and Roger C. Kendrick on moths; Mike J. Bascombe, James John Young and Philip Lo on butterflies; Wai Chun George Ho on stick insects; Jon H. Martin on aphids, psyllids and whiteflies; Guillaume-Marie de Rougemont on rove beetles; Jia Fenglong on water beetles; Yu Guoyue on ladybirds; Keith D.P. Wilson on dragonflies; John R. Fellowes and Benoit Guénard on ants; Paul W. Schaefer on *Lymantria* moths and their natural enemies; Christophe Barthélémy and John Lee on bees and wasps; Hua Lizhong on longhorns; Paul Aston on beetles; and Gao Daorong on termites.

Proper identification is one of the most important and fundamental requirements for any biological study and research. The author is indebted to the following entomologists who have provided valuable assistance in the identification of insects from Hong Kong. They include Yu Guoyue (BAAFS), Hua Lizhong (SYSU), Pang Xiongfei (deceased, SCAU), Pang Hong (GEIC), Pu Fuji (CAS), Wu Weiwen (SWAU), Yu Peiyu (deceased, CAS), Lu Wenhua (CA), Bai Ming (CAS), Nie Ruie (CAS), Yang Ganyan (formerly of CAS), Yin Huifeng (CAS), Wang Zhiliang (CAS), Yang Yuxia (CAS), Shi Hongliang (CAS), Liang Hongbin (CAS), Hu Xiaoyan (CAS), Ruan Yongying (CAS), Michael L. The author would like to take this opportunity to express his most sincere thanks to his A-level English teacher Mrs Lindy Mogford for editing the manuscript of the introductory texts. He also wishes to express his utmost gratitude to his biology teachers, namely Mr Felix Ching from Cheung Chuk Shan College, and Mrs Pauline Yip and Ms Diana Tso from Ying Wa Girls' School, who have motivated him to study biology, guided him to achieve his goal with patience, and equipped him with the skills for realising it.

緒論

本名錄旨在作為植物保護工作者、環保人士、植物檢疫官員、園藝家和自然科學愛好者的參考書。在功能上，本名錄分為兩個部分：第一部分是根據綱、目、亞目、總科、科和亞科分類的昆蟲分類學列表；第二部分則集中於昆蟲在其已知寄主下的列表。然後，再細分為四個小章節：1. 植物寄主和植食性昆蟲；2. 儲存產品和倉庫害蟲；3. 無脊椎動物寄主和捕食者、寄生昆蟲和擬寄生昆蟲；及 4. 脊椎動物寄主和具醫學／獸醫學重要性的寄生昆蟲。本名錄中的寄主是指帶有寄生物或共生體或被昆蟲捕食或進食的生物，寄主亦可以是非活生材料或動物或植物來源的物質。植物在這份名錄中包括真菌和藻類，不過，本名錄並沒有刻意區分寄主為生產宿主和非生產宿主。高度雜食性昆蟲(例如 *Bemisia tabaci* 煙粉蝨)的寄主種群分辨也不屬於本名錄的範圍。

一般來說，較為可靠的資料來源來自同行評審的科學出版物，以及來自信譽優良博物館，並符合國際植物檢疫措施標準第 5 號所定義，可易於作為查證或比較之用的未經發表的收藏記錄。香港昆蟲的衍生以及各別寄主的資料均蒐集自不同的範疇，包括科學期刊、書籍、與科學家的個人交流、未發表的報告和媒體的報道。當作者需要決定保留或放棄未有參考資料或憑證樣本支持的觀察報告時，經常發現自己處於兩難的局面。為了使記錄更加全面，除非作者確信所引用的分類單元是誤定或只是一些沒有在本地植根的外來物種，否則來自各種途徑的物種引述均會載錄於本名錄中。一些寄主的資料只是來自文獻，而寄主本身並不一定會在香港發現。儘管如此，這些記錄仍會保留在此名錄中，以方便他人將此名錄用作植物檢疫的工具書。《國際植物保護公約》公布了一項在水果上確定實蠅寄主地位的國際標準(即 ISPM 第 37 號)。不過，本名錄中所提供的寄主都沒有經過如此有力的測試。

雖然本書的標題是《香港昆蟲名錄》，但實際上這是一份六足節肢動物的清單。六足亞門是由內口綱和昆蟲綱所組成。雖然人們習慣將兩個類別的成員都視為“昆蟲”，但內口綱實際上是一類無翅節肢動物，其進化過程獨立於昆蟲之外。除網翅目，本名錄中六足亞門的分類基本上遵從 RES 採用的分類系統，。RES 將蟑螂、螳螂和白蟻歸入網翅目下，然而許多其他做分類權威將蟑螂和白蟻放在蜚蠊目下，而把螳螂留在螳螂目內。本名錄中白蟻的分類是根據 Krishna *et al.* (2013) 的觀點，將白蟻(等翅目)視為高度改良的社會性蟑螂並將其作為一個下目放置在蜚蠊目之內。螳螂(螳螂目)和蟑螂(蜚蠊目)是分別根據 Otte *et al.* (2018)和 Beccaloni (2014)來分類。甲蟲分類主要根據 Bouchard *et al.* (2011)，但作者保留了小蠹科(小蠹蟲)和長小蠹蟲科(長小蠹蟲)的地位，而沒有將它們降為象甲科的亞科。某些象鼻蟲群體被提升到科的層面並從象甲科中移除，包括長角象鼻蟲、捲葉象鼻蟲和三錐象鼻蟲。相反，隱翅蟲科現在包括一些曾被視為獨立科的亞科，例子包括蟻形隱翅蟲科和出尾蕈甲科。一些科例如糞金龜科、黑蜣科和皮金龜科，

是從金龜子科分裂出來的。步甲科的系統是根據 Anichtchenko 和 Evgeniy (2017)，將虎甲蟲(以前的虎甲科)、皺紋樹皮甲蟲(以前的條脊甲科)和螞蟻巢甲蟲(以前的 棒角甲科)組成步甲科。 蚱蜢、蝗蟲、螽斯、蟋蟀和其他直翅目成員的分類仍然存在爭議，且時有變動。本名錄採用 Cigliano *et al*. (2018) “直翅目物種在線檔案 (Orthoptera Species File Online)”的分類建議。蚜蟲是根據 Favret (2018) 的分類。許多蚜蟲的科現在被視為蚜科下的亞科，包括短痣蚜亞科、毛管蚜亞科、扁蚜亞科和大蚜亞科。 蜜蜂是根據 Michener (2007) 的分類。一些作者曾將蜜蜂分類為條蜂科，木蜂科和熊蜂科，但現在已集中歸類於蜜蜂科。蛺蝶科是根據 Nymphalidae Systematics Group (2015) 的分類。一些以前公認為獨特的科，例如斑蝶科、蛇目蝶科和袖蝶科，現在則歸入蛺蝶科內的五個主要分支。儘管分子系統發生學的研究取得了進展，但夜蛾總科的分類尚未有定論，現在仍有幾個相互競爭的分類學建議。裳蛾科現已從舊有的夜蛾科獨立出來。燈蛾科和毒蛾科現在被視為裳蛾科下的亞科。本名錄中的夜蛾科(貓頭鷹蛾)主要是根據 Brands (Ed.) (1989 年至今) 的分類。鱗翅目其餘主要科的變化是草螟科，已從螟蛾科中分裂出來及被認定為獨特的科。本名錄中的學名和所有螟蛾的分類已根據 Nuss (2003-2017) 所運作的螟蛾總科全球信息系統 (Global Information System on Pyraloidea) 作出檢查，以提高讀者的認受性，即使可能仍存在分歧。

生物體命名的科學和過程永遠在變化。隨着分類學家對動物物種及其相互關係的了解越來越多，學名可能會予以修改。有時一個物種可能已被描述而且不止一次獨立命名。其中一個例子是在各種本地榕樹上常見的木蝨。 Kuwayama (1908) 將該物種描述為 *Macrohomotoma gladiatum*。然而，大半世紀過後，Yang 和 Li (1984) 描述了另一種名叫 *Macrohomotoma sinica* 的新種。在重新檢查 BMNH 樣本，再對比 Kuwayama 及 Yang 和 Li 的原始描述後，Martin 和 Lau (2011) 得出結論，*M. sinica* 和 *M. gladiatum* 實際上是同一物種。在另一情形下，當物種被重新組合成不同的屬時，學名亦會改變。當作者仍是大學生時，番茄夜蛾和東方果實蠅的學名分別是 *Heliothis armigera* 和 *Dacus dorsalis*。幾年後，分類學家將前者命名為 *Helicoverpa armigera*，而東方果實蠅則命名為 *Bactrocera dorsalis*。由於每個物種只能有一個有效的學名，這就有了異名的產生。在香港已知的 9 000 多個昆蟲物種中，已發表的文獻提供了超過 30 000 個異名(包括錯誤拼寫)。這種廣泛的異名列表是必要的，否則讀者可能會發現本名錄遺漏了許多在各種參考文獻中所包含本地昆蟲的學名，例如，豔青尺蛾 *Agathia lycaenaria lycaenaria* 在 Lee 和 Winney (1981) 中被錯誤拼寫並錯誤鑑定為 *Agathina* [sic] *diversilinea*。同樣，由 Hill *et al.* (1982) 引用為 *Tryporyza incertulas* 的水稻螟蟲，在本名錄中被列為 *Scirpophaga obscuripes*。

一般來說，在同行評審的出版物中出現任何學名的重組建議或物種的異名化都會被本名錄所接受，而並不會考慮新有效學名的普及程度，例如，瓜實蠅最初由 Coquillett (1899)描述為 *Dacus cucurbitae*。 Drew (1989)將腹部背板已融合及沒有

融合的 *Dacus* 物種分別稱為 *Dacus* spp. 和 *Bactrocera* spp.。從此，瓜實蠅的學名被廣泛接受為 *Bactrocera cucurbitae*。最近的分子研究建議，亞屬 *Bactrocera (Zeugodacus)* 應該提升到屬的水平，因為 *Zeugodacus* 和 *Dacus* 具有共同血統，但與 Bactrocera 有所不同。 Virgilio *et al.* (2015) 在 *Zeugodacus* 下重組瓜實蠅，該物種成為 *Zeugodacus (Zeugodacus) cucurbitae*，亦是在這個名錄中使用的名稱。然而，*B. cucurbitae* 仍然被廣泛(尤其是許多國家的植物檢疫機構)引用為瓜實蠅的有效學名。

有關香港昆蟲發現的資料都蒐集自廣泛的科學文獻和媒體報道。只有一小部分資料來源是由已驗證的事實和研究數據的支持。此外，昆蟲的命名和分類是處於不斷的交替狀態，特別是隨系譜分類學的發展。當作者已盡一切努力減少名錄中所包含的固有錯誤，但仍會提示讀者要具有判斷能力的思維及謹慎地使用本名錄。

Introduction

This checklist is intended as a tool book ---- for plant protectionists, conservationists, plant quarantine officials, horticulturists and naturalists. It is functionally split into two parts. Part I is a taxonomical listing of insects sorted according to Class, Order, Suborder, Superfamily, Family and Subfamily. Part II is devoted to the listing of insects under their known hosts. It is further subdivided into four subsections: 1. Plant Hosts and Phytophagous Insects, 2. Stored Products and Storage Pests, 3. Invertebrate Hosts and Predators, Parasites and Parasitoids, and 4. Vertebrate Hosts and Parasitic Insects of Medical/Veterinary Importance. A host in this checklist refers to an organism that harbours a parasite or a symbionts or being preyed upon or fed on by an insect. A host may also be a non-living material or substance of animal or plant origin. Plants in this checklist include fungi and algae. No effort is made to distinguish reproductive host from non-reproductive host. Host races separation for highly polyphagous insects such as *Bemisia tabaci* are also beyond the scope of this checklist.

Generally speaking, more reliable sources of information come from peer-reviewed scientific publications as well as unpublished records from a reputable museum collection where reference specimens as defined by ISPM No. 5 are accessible for the purpose of verification or comparison. The occurrence of insects from HK and information on their respective hosts were gleaned from a wide range of sources, including scientific journals, books, personal communication with scientists, unpublished reports and media coverage. The author often finds himself in a dilemma when a decision is needed to keep or discard sighting reports not substantiated by reference or vouchered specimens. For the sake of comprehensiveness, information from all sources is included in this checklist unless the author is sure that the cited taxa were mis-identifications or just hitchhikers not established locally. Some host information came from literature only. These hosts may not be necessarily occur in HK. Nonetheless, these host records are still retained in this checklist for the benefit of those who use this checklist as a plant quarantine tool book. The International Plant Protection Convention has published an international standard for the determination of host status of fruit to fruit flies (i.e. ISPM No. 37). However, none of the host given in this checklist has been subject to such vigorous testing.

Despite the title being “Checklist of Insects of Hong Kong”, this book is in fact a checklist of hexapods. Subphylum Hexapoda consists of Class Entognatha and Class Insecta. Although people used to treat members from both Classes as “insects”, Entognatha are actually a class of wingless arthropods evolved independently from that of insects, and independently within each order. The classification of Hexapoda in this checklist essentially follows that adopted by the RES with the exception of Order Dictyoptera. RES groups cockroaches, praying mantis and termites all under Dictyoptera while many other authorities group cockroaches and termites under

Order Blattodea and leave mantis under Order Mantodea. Classification of termite in this checklist follows Krishna *et al*. (2013) who treat termites (Isoptera) as highly modified social roaches and place it as an Infraorder under Order Blattaria [=Blattodea]. The classification of mantis (Order Mantodea) and cockroaches (Order Blattaria) follows that of Otte *et al*. (2018) and Beccaloni (2014) respectively. Beetle classification essentially follows Bouchard *et al.* (2011) except for the bark and ambrosia beetles in Scolytidae and Platypodidae which are kept as distinct families rather than subfamilies of Curculionidae. Certain weevil groups were raised to family level and removed from Curculionidae. They include Anthribidae (fungus weevils), Attelabidae (leaf rolling weevils), and Brentidae (straight snout weevils). Conversely, Staphylinidae now includes a few subfamilies that were once treated as separate families, examples include as Pselaphidae and Scaphidiidae. A few families like Geotrupidae, Passalidae and Trogidae are split from Scarabaeidae. The systematics of Carabidae follows that of Anichtchenko and Evgeniy (2017) who group tiger beetles (previously Cicindellidae), wrinkled bark beetles (previously Rhysodidae) and ant nest beetles (previously Paussidae) under Family Carabidae. Groupings of grasshoppers, locusts, katydids, crickets and other orthoperans are still controversial and unstable. This checklist adopts the classification of Cigliano *et al.* (2018) who maintain the "Orthoptera Species File Online". Classification of aphids follows that of Favret (2018). Many aphid families are now treated as subfamilies under Aphididae. They include Aiceoninae, Greenideinae, Hormaphidinae and Lachninae. Classification of bees follows that of Michener (2007). Bees were once classified under Anthophridae, Xylocopdiae and Bombidae by some authors, but are now collectively grouped under Family Apidae. Classification of Nymphalidae follows that of the Nymphalidae Systematics Group (2015). Some formerly well-recognised distinct families like Danaidae, Satyridae and Heliconiidae are now grouped under five main clades within Nymphalidae. Despite the advancement in molecular phylogenetic study, the classification of the Superfamily Noctuoidea is yet to reach a stable state and several competing taxonomic proposals now exist. Erebidae is now separated out from old treatments of Noctuidae. Arctiidae and Lymantriidae are now treated as subfamilies under Erebidae. The classification of Noctuidae (owlet moths) in this checklist essentially follows Brands (Ed.) (1989-present). The remaining major family change in Lepidoptera is Crambidae which has been separated out from Pyralidae and is now recognised as a distinct family. Scientific names and classification of all pyralids *s.l.* in this checklist have been checked against the Global Information System on Pyraloidea maintained by Nuss (2003-2017) to achieve wider acceptance among readers despite possible disagreement.

The science and process of naming living organisms is ever-changing. As taxonomists learn more about animal species and their interrelationships, scientific names may be revised. Sometimes a species may have been described and named more than once independently. An example is a psyllid commonly found on various local species of *Ficus*. Kuwayama (1908) described the species as *Macrohomotoma gladiatum*. Three quarters of a century later, Yang and Li (1984) described another new species called *Macrohomotoma sinica*. Upon re-examination of the BMNH specimens in

comparison with Kuwayama's and Yang & Li's original description, Martin & Lau (2011) concluded that *M. sinica* and *M. gladiatum* were in fact the same species. In other cases, the scientific name may be changed when a species is being recombined into a different genus. When the author was still a university student, the scientific names for the tomato fruitworm and the oriental fruit fly were *Heliothis armigera* and *Dacus dorsalis* respectively. A few years later, taxonomists named the former as *Helicoverpa armigera* and the oriental fruit fly as *Bactrocera dorsalis*. As each species can only have one valid scientific name, this gives rise to synonyms. Over 30 000 synonyms (including misspellings) found in the published literature are provided for the 9 000 plus species of insects known from HK. This extensive listing of synonyms is necessary, otherwise readers may find many scientific names of local insects contained in various references missing in this checklist. For instance, the nerium looper, *Agathia lycaenaria lycaenaria*, was misspelled and mis-identified under the name *Agathina [sic] diversilinea* in Lee & Winney (1981). Similarly, the paddy stem borer quoted by Hill *et al*. (1982) as *Tryporyza incertulas* is now listed as *Scirpophaga obscuripes* in this checklist.

In general, any suggested recombination of scientific name or synonymisation of species appeared in peer-reviewed publications will be accepted by this checklist irrespective of the popularity of the new valid scientific name. For instance, the melon fly was originally described by Coquillett (1899) as *Dacus cucurbitae*. Drew (1989) treated *Dacus* species with abdominal tergites being fused and not fused as *Dacus* spp. and *Bactrocera* spp. respectively. Since then the scientific name of melon fly has been widely accepted as *Bactrocera cucurbitae*. Recent molecular studies suggested that the subgenus *Bactrocera* (*Zeugodacus*) should be raised to the genus level as *Zeugodacus* and *Dacus* have a common ancestry differing from *Bactrocera*. Virgilio *et al*. (2015) recombined melon fly under *Zeugodacus* and the species became *Zeugodacus (Zeugodacus) cucurbitae*, a name used in this checklist. However *B. cucurbitae* is still being widely cited as the valid scientific name for the melon fly, particularly by many national plant quarantine authorities.

Information regarding the occurrence of insects in HK was gleaned from a wide spectrum of scientific literature and media coverage. Only a fraction of the information sources was substantiated with verifiable facts and research data. Furthermore the nomenclature and classification of insects are in a perpetual state of alteration, particularly with the advancement in phylogenetic systematics. While the author has made every attempt to reduce inherited errors contained in the checklist, readers are prompted to utilize this publication cautiously and with a discerning mind.

序

除了蜜蜂和蝴蝶等少數昆蟲，大眾對昆蟲的看法通常都是較為負面。然而事實是，許多昆蟲都是人類的好朋友。昆蟲作為農作物(例如水果、堅果和蔬菜)的傳粉媒介，在保障糧食供應方面發揮着重要的作用。蒼蠅、腐屍甲蟲、糞金龜、林地蟑螂、螞蟻和白蟻是大自然的清潔者，在生態系統中清除腐爛物質和循環營養。昆蟲亦可作為生態系統健康狀況的優良指標，例如蜉蝣常被用作水生環境的指標。同時，昆蟲在美學及教育方面的價值亦很高。政府在大埔滘、城門、大欖、石崗及香港仔等多個地點已設立了戶外學習中心及蝴蝶園，推廣自然探索。此外，許多昆蟲是有害生物的天敵，能有效地防治植物病害蟲。

儘管香港面積細小，但我們的生物多樣性卻非常豐富。我們的土地孕育着超過 3 300 種維管植物，包括 2 100 種本土物種。我們還有許多脊椎動物物種，包括 55 種陸生哺乳動物、550 多種鳥類、184 種淡水魚類和超過 100 種兩棲爬行動物。然而，我們的動物群絕大多數是昆蟲，相信牠們佔地球上八成的動物物種。本名錄正好填補我們對最大的無脊椎動物群落的了解。

蘇培業先生(1961)和李熙瑜先生及溫禮賢先生(1981)先後出版了《香港具農業重要性的昆蟲初步名錄》和《香港農作昆蟲名錄》。兩本名錄都把重點放在農業昆蟲上。蘇培業先生對 300 種本地昆蟲物種進行了編目，而李熙瑜先生及溫禮賢先生則在 20 年後將數量增加到 1 155 種。目前的名錄包含 9 060 種昆蟲、分為 29 目、200 總科、479 科和 1 052 亞科。除了為更多的物種進行編目外，當前和過去工作之間最顯著的差異在於載錄 30 028 個同物異名的品種名字，讓讀者能交叉檢查各方文獻以獲得更多資訊。

我謹祝賀作者完成了這本非常有用的參考書。這本名錄不僅對農民、生物學家和植物檢疫政府人員有所裨益，對昆蟲和野生動物有興趣的業餘愛好者同樣具參考作用。

Foreword

Apart from a few such as bees and butterflies, the general perception of insects is usually on the negative side. Yet the fact is that many species of insects are good friends of mankind. Insects serve a vital role in food security as pollinators of crops such as fruits, nuts and vegetables. Insects like flies, carrion beetles, dung beetles, woodland cockroaches, ants and termites are natural cleaning workers, removing decaying materials and recycling nutrients in ecosystems. Insects are also excellent indicators of the health of an ecosystem and mayflies, for example, are often used as indicators in the aquatic environment. Insects also possess great aesthetic and education value. Outdoor study centres and butterfly gardens have been set up by the Government in a number of places such as Tai Po Kau, Shing Mun, Tai Lam, Shek Kong and Aberdeen to promote nature exploration. Furthermore, many insects are biological control agents which function effectively to keep plant pests in check.

Despite the small size of Hong Kong, we have an amazingly rich biodiversity. Our land supports more than 3 300 species of vascular plants, including 2 100 native species. We also have a considerable number of vertebrate species, including 55 species of terrestrial mammals, more than 550 species of birds, 184 species of freshwater fish and over 100 species of herpetofauna. Yet the great majority of our fauna are insects which are believed to account for 80% of animal species on earth. This checklist seeks to fill our knowledge gap for the biggest group of invertebrate fauna.

The “Preliminary List of the Insects of Agricultural Importance in Hong Kong” and the “Check List of Agricultural Insects of Hong Kong 1981” were written by Mr P.Y. So (1961) and Messrs L.H.Y. Lee and R. Winney (1981) respectively. Both publications focused on agricultural insects. Mr So catalogued 300 local species, while Messrs Lee and Winney increased the count to 1 155 two decades later. The current checklist contains 9 060 species of insects that are sorted into 29 Orders, 200 Superfamilies, 479 Families and 1 052 Subfamilies. Apart from cataloguing more species, the most significant difference between the current and past work lies in the inclusion of 30 028 synonyms which allows readers to cross check against other references for additional information.

I would like to congratulate the author on producing this very useful reference book which will benefit not only farmers, biologists and plant quarantine officials, but also amateurs who have a general interest in insects and wildlife.
